

Cross-Sell Prospect Identification — Requirements & ICP Criteria

Status: Draft v1 — informs the "Cross-Sell Customers" page under Prospects in the FY27 Pipeline Analytics app. **Author context:** Written from HGS's live HubSpot CRM schema, the HGS Plays Portfolio (<https://hgs-portfolio-static.vercel.app> (<https://hgs-portfolio-static.vercel.app>)), and the existing ad hoc whitespace analysis in `HGS_Master_Customer_Analysis-v5.xlsx`.

1. Purpose & Scope

Define, in concrete and computable terms, what makes an **existing HGS customer** a good **cross-sell prospect** — i.e., a candidate for landing a new service line or portfolio play beyond what they already buy. This is deliberately scoped to the *existing customer base*, not net-new logo acquisition:

Motion	Population	Out of scope here?
New Logo	Never a customer	Yes — different ICP/qualification problem (firmographic fit + intent signals, no HGS history to lean on)
Cross-Sell (this doc)	Status = Current (or Current & Previous), buying ≥1 service line today	In scope
Win-Back	Status = Previous only (churned/lapsed)	No — related, but a different motion (re-engagement, not expansion); HGS already has a "Win-Back Targets" cut in the master analysis

A cross-sell prospect, concretely: **an active HGS account with room to buy something they don't already buy, where HGS has a right to win and a reasonable path to a warm conversation.**

This maps directly onto a field HGS's own CRM already uses: `dealtype = ECNB` ("Existing Customer, New Business") is literally the deal-type code for a cross-sell deal, as distinct from `NCNB` (new logo), `ECEB` (existing customer, existing business — a renewal/expansion of what they already have), and `Framework` (MSA-level). The criteria below are, in effect, a leading indicator for "which current accounts are likely to produce an ECNB deal next."

2. Grounding: HGS's Actual Portfolio & Data Model

2.1 The HGS Plays Portfolio (three pillars)

The portfolio site organizes everything HGS sells into three portfolios, each with a handful of strategic plays, each broken into six-step project-play journeys:

Portfolio	Promise	Strategic Plays	Buyer
Intelligent Interactions	Grow Customers	Marketing Transformation · Service Experience Transformation · Sales Transformation	CMO, VP CX, VP Sales
Intelligent Platforms	Build Digital Foundations	Enterprise Planning · Data & AI Foundation · Content & Context Foundation · Application & Cloud Modernization	CIO, CTO, CDO
Intelligent Operations	Run AI-Native Operations	Employee & Enterprise Operations · Industry Managed Services · Outcome-Based Operations Transformation	COO, CFO, Shared Services / vertical Ops heads

Industry Managed Services (inside Intelligent Operations) is explicitly organized by vertical — **BFSI, Insurance, Healthcare, Retail & CPG, Telecom** — each with its own named project play (Banking Operations/KYC/AML/Collections, Insurance Claims Operations, Healthcare Member/Provider Services Operations, CPG/Retail Operations, Telecom & Network Operations). This is the clearest signal of where HGS has invested in vertical depth, and it's the natural first filter for industry-fit scoring below.

2.2 The service lines HGS already tracks, and coverage today

The existing `HGS_Master_Customer_Analysis-v5.xlsx` (Service Line Coverage tab) tracks exactly **9 service lines** across the current book of business:

Service Line	# Current Clients Using	% of Current Clients	Maps to portfolio
Data & Analytics	82	16.0%	Intelligent Platforms → Data & AI Foundation
Staff Augmentation/Consulting	76	14.9%	Intelligent Operations → Outcome-Based Transformation (Flexible Talent & Expert Services)
Cloud & Infrastructure	68	13.3%	Intelligent Platforms → Application & Cloud Modernization
Digital/Automation/RPA	67	13.1%	Intelligent Platforms (Platform Engineering) / Intelligent Operations (automation)
Voice/Contact Center/BPO	62	12.1%	Intelligent Interactions → Service Experience Transformation
Marketing/Social Media	58	11.4%	Intelligent Interactions → Marketing Transformation
Planning/Finance Systems	55	10.8%	Intelligent Platforms → Enterprise Planning
SAP/ERP Consulting	50	9.8%	Intelligent Platforms → Application & Cloud Modernization
CX/CRM Platforms	29	5.7%	Intelligent Interactions → Sales/Service Transformation

Two things worth noting for whoever builds on this:

1. **This 9-line taxonomy predates the 3-portfolio/10-strategic-play structure** on the live portfolio site. They're conceptually compatible (mapping above), but not identical, and HGS's CRM `service_line` field on deals is **free text**, not a picklist against either taxonomy — the app today shows whatever string a rep typed (e.g., "Digital Engineering", "Contact Center Modernization", "HGS Staffing – OSS Salary").

Recommendation: normalize `service_line` into a controlled picklist (ideally aligned to the 10 strategic plays, since that's the forward-looking sales motion) so whitespace math is precise instead of approximate. Until that lands, whitespace scoring has to work off the

count of distinct service-line strings per account, not a clean check against the canonical 9 (or 10).

2. The technology/platform partner roster on deals (`partner_account__c` : AWS, Genesys, Twilio, Microsoft, SAP, Snowflake, Databricks, UiPath, Automation Anywhere, Sprinklr, Anaplan, Pigment, Onestream, ContentStack, Drata, SentinelOne, ...) lines up cleanly with the Intelligent Platforms and Intelligent Interactions plays and is a second, corroborating whitespace signal: an account using a partner platform HGS already integrates with (e.g., a Genesys or Twilio shop) is a warmer lead for Service Experience Transformation than one with no CX platform relationship at all.

2.3 HGS's own account-tiering fields (already in HubSpot, already in this app)

Two HubSpot company properties already do real ICP/relationship classification work — this doc builds on them rather than inventing a parallel system:

`hs_ideal_customer_profile` ("ICP Tier") — HGS has defined ICP explicitly around company **revenue size**:

Value	Meaning
Large (\$5B+)	Enterprise — largest expansion headroom, most budget, longest sales cycles
Mid (500M–5B)	Core mid-market — HGS's bread-and-butter account size
Small (< \$500M)	Smaller accounts — real but bounded expansion ceiling

`account_sales_tier__c` ("Account Sales Tier") — a relationship-stage field, not a size field:

Existing Client - Strategic · Existing Client · New Client (12 mos.) - Strategic ·
New Client (12 mos.) · Tier 1 / Tier 2 / Tier 3 · Previous Client · Client ·
Channel Partners · Analyst · Agency

The "Strategic" variants are HGS's own flag for its most important relationships — treat as a strong positive signal, not just a label. `Previous Client` should always route to Win-Back, never Cross-Sell.

This app already surfaces both fields (`icpTier` , `accountSalesTier`) plus `status` (Current / Previous / Current & Previous, derived from `is_current` / `is_previous`), `industry` ,
`numOpenDeals` , `numWonDeals` , `numContacts` , `totalRevenue` , `revenueFY27` , `revenueFY28` ,

and `serviceLines` (the distinct list of service-line strings associated with the account) on the Master Customer data model — **every field this framework needs already exists in the data pipeline**. No new HubSpot properties or backend fields are required to ship v1.

2.4 Prior art: the existing ad hoc "Whitespace Score"

`HGS_Master_Customer_Analysis-v5.xlsx`'s "Whitespace Opportunities" tab already assigns every account a Whitespace Score. Reverse-engineering the ~100 rows shows the formula is:

```
Whitespace Score = ICP_Weight × (9 - Num Service Lines Identified) where  
ICP_Weight: Large ($5B+) = 3, Mid ($500M-5B) = 2, Small (<$500M) = 1
```

i.e., score = tier weight × service lines *not yet* bought, out of the 9 tracked. It's a reasonable first cut — bigger account + more whitespace = higher score — but it has real gaps this framework is designed to close:

- **No relationship-health signal at all.** A large account with zero won deals and zero contacts scores identically to one with a thriving, multi-year relationship and an active champion, as long as service-line count matches. That's backwards — the accounts most likely to actually convert on a cross-sell are the ones with *proven* delivery success, not just "hasn't bought much yet."
- **No revenue-in-hand signal.** Doesn't distinguish a *50K logo from a 10M* relationship within the same ICP tier.
- **No industry/vertical-fit signal.** Treats a BFSI account (where HGS has a named Industry Managed Services play) the same as an industry HGS has no dedicated play for.
- **No exclusion for lapsed relationships** — worth double-checking the underlying data doesn't leak `Previous`-only accounts into the whitespace cut.

Section 5 below proposes a scorecard that keeps the whitespace insight but adds these three dimensions.

3. What Good Looks Like: the Cross-Sell ICP

Combining HGS's own ICP definition (§2.3) with the portfolio structure (§2.1), the ideal cross-sell prospect looks like this:

- **Size:** Mid-to-Large ICP tier (\$500M+ revenue) — big enough to have multiple buying centers and budget for a second service line, without requiring the multi-year enterprise sales cycle of the very largest accounts. (Large accounts are still excellent targets — they just take longer and need executive-sponsor mapping before they'll convert.)

- **Industry:** Ideally BFSI, Insurance, Healthcare, Retail/CPG, or Telecom — HGS has a named, productized Industry Managed Services play and delivery pattern for each. Outside those five, HGS can still sell (Intelligent Interactions and Intelligent Platforms are industry-agnostic), but there's no vertical-specific playbook to lean on.
- **History:** Already `Current` (not lapsed), with at least one closed-won deal (proven delivery, not just a logo on paper) and visible recent activity (open deals and/or contacts on file) — a relationship someone can actually pick up the phone on.
- **Service Line coverage:** Buying 1–3 of the ~9 tracked service lines today, not the full spread — real whitespace remains, but there's enough of an existing footprint that HGS already has a foot in the door (a security-vetted vendor, an existing SOW/MSA, a known point of contact).
- **Existing relationship / account tier:** `account_sales_tier__c` of `Existing Client` or, ideally, `Existing Client - Strategic` — HGS has already decided this relationship matters.
- **Platform adjacency:** Uses a partner platform (Genesys, Twilio, Snowflake, SAP, Anaplan, etc.) that HGS already integrates with for a play the account doesn't yet have — a corroborating, not primary, signal.

The **worst** cross-sell candidate, by contrast: `Previous`-only status (lapsed — that's Win-Back), Small ICP tier with zero won deals (unproven, low ceiling), an industry with no HGS vertical play and no platform adjacency, and/or full coverage across all tracked service lines already (nothing left to sell).

4. Criteria Framework

Four dimensions, matching how the business actually asks the question ("how big are they, what industry, how long/well have we worked with them, what do they already buy from us"):

4.1 Size (firmographic)

Signal	Field	Why it matters
ICP Tier	<code>icpTier</code> (<code>hs_ideal_customer_profile</code>)	HGS's own revenue-band classification; primary size signal
Annual Revenue	<code>annualRevenue</code>	Backs up ICP tier where it's blank/stale; finer-grained than the 3 tiers
Total HGS revenue to date	<code>totalRevenue</code>	Size of the <i>relationship</i> , not just the company — a proxy for wallet share and buying-center depth

4.2 Industry

Signal	Field	Why it matters
Industry	<code>industry</code>	Maps to a named HGS vertical play (BFSI/Insurance/Healthcare/Retail-CPG/Telecom) or not — determines which strategic play to lead with, and whether a productized delivery pattern exists
Country / region	<code>country</code>	Secondary — informs which HGS business unit/delivery center is the natural owner (see <code>originating_business_unit__c</code> : APAC, UK, USA, LatAm, HGS Digital, TekLink, ...)

4.3 History (relationship health & momentum)

Signal	Field	Why it matters
Status	<code>status</code> (Current / Previous / Current & Previous)	Hard gate — Previous-only is Win-Back, not Cross-Sell
Account Sales Tier	<code>accountSalesTier</code>	<code>Existing Client - Strategic</code> is HGS's own flag for its most important relationships
Won deals	<code>numWonDeals</code>	Proven delivery — the strongest "we can execute for this account" signal
Open deals	<code>numOpenDeals</code>	Active engagement right now — a live reason to be in the account already
Associated contacts	<code>numContacts</code>	Relationship breadth/access — more contacts means an easier warm intro to a second buying center
Lifecycle stage	<code>lifecycleStage</code>	Sanity check against status (e.g., "customer" should correlate with <code>Current</code>)

4.4 Service Line (existing footprint / whitespace)

Signal	Field	Why it matters
Distinct service lines bought	<code>serviceLines</code> (count)	Core whitespace measure — fewer today = more room to grow, <i>given</i> the account is otherwise healthy
Which service lines, specifically	<code>serviceLines</code> (list)	Determines <i>which</i> strategic play to lead with next — e.g., an account with Voice/Contact Center only is a natural fit for Marketing Transformation or Data & AI Foundation next, not another CX play
Platform/partner adjacency	<code>partner_account__c</code> on deals (not yet in this app's data model)	Corroborating signal — using a partner platform HGS already integrates with lowers integration risk for the next sale

5. Proposed Scoring Model

A single **Cross-Sell Fit Score (0–100)**, computed only for accounts with `status ∈ {Current, Current & Previous}` (Previous-only accounts are excluded entirely — they belong on a Win-Back list, not this one):

Component	Weight	Computation
Whitespace	35 pts	<code>35 × (1 - serviceLines.count / max_service_lines_observed)</code> — fewer existing service lines (relative to the widest-covered account in the book) → higher score
Size / ICP Tier	25 pts	Large (5B+) = 25 · Mid(500M–5B) = 17 · Small (<\$500M) = 8 · unknown = 4
Relationship Health & Momentum	25 pts	<code>numWonDeals > 0</code> → +12 (proven delivery) · <code>numOpenDeals > 0</code> → +6 (active engagement) · <code>numContacts ≥ 3</code> → +7 (relationship access); capped at 25
Industry / Vertical Fit	15 pts	Industry matches a named HGS vertical play (BFSI/Banking/Financial Services, Healthcare/Insurance, Retail/CPG, Telecom) → 15 · other known industry → 7 · blank → 4

Tiering (for prioritization, not just a raw number). Thresholds are calibrated against the actual score distribution on the live book (726 Current accounts), not round numbers picked in the abstract — most current accounts show 0–2 identified service lines, so whitespace + size + industry alone put a lot of the book in the 50s–60s before relationship signal is even added. Round thresholds of $\geq 70/45$ put **99% of the entire book in Hot+Warm**, which isn't a useful prioritization; the calibrated thresholds below put roughly the top 15–20% in Hot and the bottom 10–15% in Monitor instead:

Tier	Score	~Share of book (observed)	Meaning
 Hot	≥ 75	~17%	Lead with this quarter — big, healthy relationship, real whitespace, clear play to pitch
 Warm	55–74	~70%	Good candidate — qualify further (confirm sponsor access, validate whitespace against actual play needed) before investing outreach
 Monitor	< 55	~13%	Either too little whitespace (already broad coverage), too little relationship depth to lean on yet, or too small to prioritize right now — revisit if status changes

Re-check these percentile cut points against the live distribution any time the weights change — a threshold tuned for one weighting scheme won't necessarily still produce a useful split under a different one.

This keeps the existing spreadsheet's core insight (bigger account + more whitespace = better prospect) but stops a large, cold, zero-relationship account from outscoring a mid-size account with a proven, active, multi-contact relationship — which is the gap most likely to send sellers chasing the wrong accounts first.

Known v1 simplification: because `service_line` is free text rather than a controlled picklist (§2.2), "whitespace" here is a *relative* measure (this account's service-line count vs. the widest-covered account currently in the book), not an absolute count against the canonical 9-line (or 10-play) taxonomy. Once `service_line` is normalized to a fixed list, whitespace scoring should switch to the absolute form used in §2.4's reverse-engineered formula (count against the true universe of lines/plays, not the observed max), and should also start recommending the *specific* next play rather than just a whitespace score.

6. General B2B Cross-Sell Best Practices

Beyond the HGS-specific criteria above, a few principles from account-based expansion selling worth building into how this page evolves:

1. **Segment before you score.** Don't run one funnel-wide model — the right ICP profile differs by portfolio (an Intelligent Operations sale to a COO looks nothing like an

Intelligent Interactions sale to a CMO). Where possible, score *fit for a specific next play*, not just "fit for HGS in general."

2. **Whitespace ≠ intent.** A gap in coverage is necessary but not sufficient — pair it with a trigger event (new exec hire, funding round, M&A, a competitor's contract expiring, a support ticket spike, a champion changing roles) wherever that signal is available. This app doesn't have trigger-event data yet; it's a natural v2 addition (news/intent-data feed, or manual notes from the account team).
3. **Map the buying committee, not just the account.** `numContacts` is a coarse proxy for access — the real question is whether HGS has a relationship with the specific buyer for the *new* service line (e.g., the CX contact HGS already has doesn't help sell into Finance). Longer-term, this argues for tracking contact-level role/department, not just a company-level count.
4. **Land-and-expand cadence matters more than a single score.** The best-run cross-sell motions review this list on a fixed cadence (monthly/quarterly) tied to QBRs, not ad hoc — the Hot/Warm/Monitor tiers above are designed to slot into that rhythm.
5. **Wallet share, not just revenue.** `totalRevenue` at HGS says nothing about the account's *total* spend on the categories HGS could sell into. Where available (e.g., from a G2000-style estimate or the account team's own knowledge), a wallet-share estimate turns "this account is big" into "this account spends *X on X and HGS has 0* of it."
6. **Health gates before growth gates.** An account with open delivery/risk issues (escalations, at-risk renewals, low CSAT) is a bad cross-sell target no matter how much whitespace exists — expansion conversations land better from a position of proven success. This app doesn't yet have a health/CSAT signal; the Deal Health & Risk page's hygiene flags are the closest proxy today and could be joined in as a negative modifier.
7. **Score decay.** Relationship signals (contacts, recent activity) go stale — a score computed once and never refreshed drifts from reality within a quarter. Recompute on every data refresh (this app already re-ingests HubSpot data as a snapshot, so this falls out for free) rather than treating it as a one-time exercise like the source spreadsheet.

7. Data Requirements Summary

Everything needed for the v1 scoring model above is already present in this app's data

```
pipeline ( build_customers_list in backend/ingest/aggregate.py ): icpTier ,  
accountSalesTier , status , industry , numWonDeals , numOpenDeals , numContacts ,
```

`totalRevenue`, `revenueFY27`, `annualRevenue`, `serviceLines`. **No new backend fields, HubSpot properties, or ingest changes are required to ship the Cross-Sell Customers page.**

Gaps for a v2, in priority order:

1. **Normalize** `service_line` **to a controlled picklist** (ideally the 10 strategic plays) — turns relative whitespace into precise, actionable "sell them Play X next" guidance.
2. **Surface** `partner_account__c` **(deal-level platform partner) at the account level** — a real, already-captured corroborating whitespace signal this app doesn't currently roll up to the customer object.
3. **A health/risk modifier** joined from the existing Deal Health & Risk hygiene flags, so an at-risk account doesn't get recommended for expansion outreach.
4. **Trigger-event / intent data** (exec changes, funding, competitor contract expiry) — not in HubSpot today; would need a new source (news/intent feed or manual account-team notes).
5. **Contact-level role/department** — to move from "N contacts" to "do we know the buyer for the specific play we'd pitch."

8. Open Questions

- Should Cross-Sell scoring exclude accounts below a minimum `totalRevenue` or deal-count floor regardless of tier, to keep the list focused on accounts sellers can realistically prioritize this quarter?
- Should `Existing Client - Strategic` accounts get a fixed bonus/floor on top of the formula (i.e., a strategic account should probably never show as "Monitor" even with full service-line coverage, since there may be adjacent/renewal plays not captured by whitespace alone)?
- Who owns re-validating the Industry → HGS-vertical mapping in §4.2 as HGS's own portfolio/plays evolve?
- **Data-quality note found while building v1:** `status` (derived from HubSpot's `is_current` / `is_previous`) and `account_sales_tier__c` sometimes disagree on the same company — e.g. an account showing `status = Current` (and so included here) while `account_sales_tier__c = "Previous Client"`. This framework trusts `status`, matching how the rest of this app already partitions Current vs. Previous — but it means `accountSalesTier` shown alongside a Cross-Sell row shouldn't be read as a second

confirmation of "current," just as HGS's own relationship-stage label, which can lag.
Worth a CRM data-hygiene pass independent of this feature.
